Intercom

For Broadcast and Media

Improve coordination between field crews and the station with a software enhancement that enables real-time, two-way communication.

What it Does

Provides two-way, full-duplex, encrypted voice communication between the station and a camera operator in the field.

What it Delivers

Plug and Play Communication

Two-way communication can begin as soon as a headset is connected to an EnGo. Intercom works when the EnGo is ready to transmit and when it is live.

Enhanced Coordination

Keeps field teams synchronized with the station for seamless live broadcasts from the field.

Free Software Enhancement

Software updates are free with a qualifying support contract and there are no additional license fees required for Intercom functionality.

Intercom feature works independently of one-way IFB, offering the ability to have an IFB channel for talent and a two-way Intercom channel for the camera operator.

Supported Devices

Transmitters	EnGo 1.3, EnGo 260
Receivers	WayPoint 50, WayPoint 104
Requirements	
Software	Core 5.4 software, MOTU 4pre software installed by Support
